What is Combined Cycle Power Plant (CCPP)?
Combined Cycle Power Plant is used to generate electricity. Most of the time, it is also termed as the Combined Power Gas Turbine. It is also abbreviated as the CCPP. The primary purpose of using this power plant is to produce more electricity with higher efficiency.

Combined cycle power plant as in name suggests, it combines existing gas and steam technologies into one unit, yielding significant improvements in thermal efficiency over conventional steam plant. In a CCGT plant the thermal efficiency is extended to

approximately 50-60 per cent, by piping the exhaust gas from the gas turbine into a heat recovery steam generator.

~~An Overview of Combined Cycle Power Plant~~

As the name combined cycle suggests, this type of power plant comprises of a combination of both gas and steam power production technologies. A combined cycle power plant relies on the simple fact that a gas turbine produces both power and hot exhaust gases. As the power is channeled to a generator, the hot gases are used to produce steam.

The Flexicycle power plant is a combined cycle power plant with unique characteristics based on Wärtsilä gas or dual-fuel combustion engines. Because combustion engines convert more of the fuel energy into mechanical work, they have higher simple cycle efficiencies, averaging near 50 percent.

~~Combined Cycle Plant for Power Generation- Introduction~~

Combined cycle power plant or Combined cycle gas turbine is a combination of both gas and steam power production technologies able to achieve efficiency by up to 60%. It is a natural gas power plant consisting

~~Combined Cycle Power Plant – Top Electrical Engineers~~

An integrated gasification combined cycle (IGCC) is a technology that uses a high pressure gasifier to turn coal and other carbon based fuels into pressurized gas—synthesis gas (H_2). It can then remove impurities from the syngas prior to the power generation cycle. Some of these pollutants, such as sulfur, can be turned into re-usable byproducts through the Claus process.

Combined Cycle plants use fuel gas that can contain significant levels of contamination in the form of solids, gels, water, and salts. Left unchecked they can hinder operations by increasing maintenance and component replacement costs.

A combined cycle power plant is a combined system that drives gas turbines with the explosive force of compressed fuel gas for primary power generation, and drives steam turbines for secondary power generation by producing steam at the heat recovery steam generator (HRSG) by making use of exhaust gases generated by the gas turbine.
