Diffusion of small molecules through the polymers has significant importance in different scientific and engineering fields such as medicine, textile industry, membrane separations, packaging in food industry, extraction of solvents and of contaminants, and etc. Mass transfer through the polymeric membranes including dense and porous membranes depends on the factors included solubility and diffusivity of the penetrant into the polymer, morphology, fillers, and plasticization.

Diffusion coefficients of several solute-polymer systems can be characterized by an exponentially dependent function $D = D_0 \exp(-AC)$. The cumulative mass uptake after a step increase of the solute concentration at the surface was considered using a film with a finite thickness and a semi-infinite domain. For finite film the
