by Electrical4U. A control system is a system of devices that manages, commands, directs or regulates the behavior of other devices to achieve a desired result. In other words, the definition of a control system can be simplified as a system which controls other systems to achieve a desired state. There are various types of control systems, which can be broadly categorised as linear control systems or non-linear control systems.

LINEAR STATE-SPACE CONTROL SYSTEMS

A linear system is a system where input/ output relationships may be represented by a linear differential equation. The plant is linear if it can be accurately described using a set of linear differential equations. This attribute indicates that system parameters do not vary as a function of signal level.

Stability is one of the important characteristics of control systems analysis. In the linear sense, the stability is characterized by the system producing a bounded output when excited by a bounded input (Ogata, 1979).

Every control system must guarantee first the stability of the closed-loop behavior. For linear systems, this can be obtained by directly placing the poles. nonlinear control systems use specific theories (normally based on Aleksandr Lyapunov's Theory) to ensure stability without regard to the inner dynamics of the system. The possibility to fulfill different specifications varies from the model considered and the control strategy chosen.

Control systems described by the Lur'e problem have a forward path that is linear and time-invariant, and a feedback path that contains a memory-less, possibly time-varying, static nonlinearity. The linear part can be characterized by four matrices (A, B, C, D) , while the nonlinear part is $\Phi(y)$ with $\frac{\Phi(y)}{y} \in [a, b]$, $a < b$ (a sector nonlinearity).
