ABC analysis (or ABC classification) is used by inventory management teams to help identify the most important products in their portfolio and ensure they prioritize managing them above those less valuable. The ABC analysis is a very good start but we will often find 2 classic mistakes in companies:. Similarly, new products will distort the analysis as well. ABC-XYZ analysis can be a powerful diagnostic tool, as well as very helpful for allocating resources in the forecasting process.

Operation Enduring Freedom and Operation Iraqi Freedom. This report identifies ways in which analysts have attempted to support commanders' decisions in counterinsurgency and irregular warfare, describes many of the models and tools they employed, provides insight into the challenges they faced, and suggests ways in which the application of modeling, simulation, and analysis might be improved for current and future operations. RAND identified four broad categories of decisions: force protection, logistics, campaign assessment, and force structuring. Modeling, simulation, and analysis were most effective in supporting force protection and logistics decisions, and least effective in supporting campaign assessment and force structuring.

The history of wars caused by misjudgments, from Napoleon ' s invasion of Russia to America ' s invasion of Iraq, reveals that leaders relied on cognitive models that were seriously at odds with objective reality. *Blinders, Blunders, and Wars* analyzes eight historical examples of strategic blunders regarding war and peace and four examples of decisions that turned out well, and then applies those lessons to the current Sino-American case.

Given the wide-ranging implications for global competition, domestic political systems and daily life, US policymakers must prepare for the impacts of new artificial intelligence (AI)-related technologies. Anticipating AI's impacts on the global order requires US policy makers' awareness of certain key aspects of the AI-related technologies--and how those technologies will interact with the rapidly changing global system of human societies. One area that has received little in-depth examination to date is how AI-related technologies could affect countries' domestic political systems--whether authoritarian, liberal democratic, or a hybrid of the two--and how they might impact global competition between different regimes. This work highlights several key areas where AI-related technologies have clear implications for

Looking to the 2030 – 2040 time frame, U.S. policy and military strategy will need to strike a balance among maintaining a cooperative relationship with China, deterring Chinese aggression in regional disputes, and preparing for the possibility that China could become more assertive. The U.S. Army will have an important role to play in preparing for these developments and for protecting and furthering U.S. interests in the region.

Between March and October 2011, a coalition of North Atlantic Treaty Organization (NATO) member states and several partner nations waged a war against Muammar Qaddafi's Libyan regime that stemmed and then reversed the tide of Libya's civil war, preventing Qaddafi from crushing the nascent rebel movement seeking to overthrow his dictatorship and going on to enable opposition forces to prevail. The central element of this intervention was a relatively small multinational force's air campaign operating from NATO bases in several countries, as well as from a handful of aircraft carriers and amphibious ships in the Mediterranean Sea. The study details each country's contribution to that air campaign, examining such issues as the limits of airpower and coordination among nations. It also explores whether the

In response to a surprise incursion by Hezbollah combatants into northern Israel and their abduction of two Israeli soldiers, Israel launched a campaign that included the most complex air offensive to have taken place in the history of the Israeli Air Force (IAF). Many believe that the inconclusive results of this war represent a "failure of air power." The author demonstrates that this conclusion is an oversimplification of a more complex reality. He assesses the main details associated with the Israeli Defense Forces' (IDF's) campaign against Hezbollah to correct the record regarding what Israeli air power did and did not accomplish (and promise to accomplish) in the course of contributing to that campaign. He considers IAF operations in the larger

This volume is of special relevance in light of the profound changes occurring within the Chinese People's Liberation Army (PLA). China's desire to develop a military commensurate with its diverse interests is both legitimate and understandable. The challenge for U.S. Pacific Command (USPACOM) is to understand how China will employ this growing military capability in support of its interests. The book addresses the uncertainty surrounding the potential direction of the PLA by examining three distinct focus areas: domestic, external, and technological drivers of PLA modernization; alternative futures for the PLA; and, implications for the region, world, and U.S.-China relations. The analysis provides an insightful perspective into the factors shaping and propelling the PLA's modernization, its potential future
