Coal mine disasters in the United States are relatively rare events; many of the roughly 50,000 miners underground will never have to evacuate a mine in an emergency during their careers. However, for those that do, the consequences have the potential to be

Access Free
Underground
devastating. U.S. mine
safety practices have
received increased
attention in recent years
because of the highly
publicized coal mine
disasters in 2006 and
2010. Investigations
have centered on
understanding both how
to prevent or mitigate
emergencies and what
capabilities are needed
by miners to self-escape

to a place of safety successfully. This report focuses on the latter - the preparations for self-escape. In the wake of 2006 disasters, the U.S. Congress passed the Mine Improvement and New Emergency Response Act of 2006 (MINER Act), which was designed to strengthen existing mine safety regulations and

set forth new measures aimed at improving accident preparedness and emergency response in underground coal mines. Since that time, the efforts of the National Institute of Occupational Safety and Health (NIOSH) and the Mine Safety and Health Administration (MSHA) have contributed to safety improvements in

However, the Upper Big
Branch mine explosion
in 2010 served as a

reminder to remain ever
vigilant on improving
the prevention of mine
disasters and

preparations to help
miners survive in the

This study was set in the
context of human-
systems integration

Access Free Underground Mine Foreman

(HSI), a systems approach that examines the interaction of people, tasks, and equipment and technology in the pursuit of a goal. It recognizes this interaction occurs within, and is influenced by, the broader environmental context. A key premise of human-systems integration is

Access Free Underground

that much important information is lost when the various tasks within a system are considered individually or in isolation rather than in interaction with the whole system.

Improving Self-Escape from Underground Coal Mines, the task of self-escape is part of the mine safety system.

The National Institute for Occupational Safety and Health (NIOSH) with assistance from MSHA, conducted an extensive review of bulkhead permits submitted to MSHA's technical Support office in Bruceton, PA. This NIOSH Information Circular was developed for operations that need to construct an

impoundment system, as well as for those that currently operate one.

The information contained in this report is geared toward the permitting aspect.

However information on monitoring and emergency response planning and training could be useful to operations that currently

proactive strategies for
underground safety
management with an
emphasis on planning
for safety, safety
regulations, and the
enforcement of such
regulations. Also
included are illustrations
of successful
approaches in creating a

Originally known as El Cobre, the mining-military camp of Santa Rita del Cobre ultimately became the company town of Santa Rita, which after World

occupational safety and health policies as well as ILO instruments on occupational safety and health. It also takes into consideration new technology; a leaner, multiskilled workforce; and a less prescriptive, more systems-oriented approach to addressing safety and health. The code specifies the roles of authorities,
